

NEW AQUARI-SAVE WATER CONTROL VALVE

AQUARI-SAVE

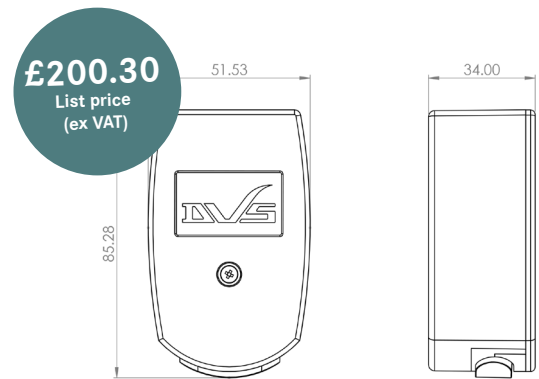

The Aquari-Save water control valve has been designed to reduce water consumption by setting a pre-determined frequency of water release, reducing the amount of water usage per day. When used in conjunction with the handheld programmer, adjustable time durations can be set, including flush times, hygiene purges and other water usage. The unit can be installed quickly and easily and, when used effectively, can conserve water in various commercial buildings such as stadiums, restaurants, schools, offices and more.

Parameters

A range of different settings and parameters can be set according to a users needs and requirements including:

- Days of the week - adjust to suit different days of the week
- First flush - the first time that water is used on that set day
- Last flush - the last time that water is used on that set day
- Number of flushes - set the number of flushes per day
- Adjustable run times - 2, 5, 10, 15, 20, 30, 40, 50 & 60 seconds

The programmer will set the water usages at equal time distances of time within the pre-set first and last flush time, for example, if you set 6 flushes in 6 hours, it will flush once per hour. Each day will need to be programmed individually giving you greater control over your water usage.
