

# Vulcan Architectural

A brand new product

**SkateStop™**

Architecturally unobtrusive skate deterrent hardscape fittings  
on duty 24 hours a day, 7 days a week, 365 day a year

# Why?

Skates and skateboarding are harmless activities, giving performers fresh air and keeping fit. This is excellent but should be kept in designated areas.

SkateStop is your high alert security guard, ensuring that your public local street scape, hard scape, commercial areas and shopping precincts do not become a practise ground for uninviting and destructive pastimes.

# How?

These can be added into specification documents at design stage, being included in the stone mason or civils package. Retrofitted later, after project completion does not cause a problem, but care should be taken throughout the installation process.

# What?

Marine Grade Stainless Steel 316 or Brass (specials).

# Three Styles . . . . .

Skate Stop Discs (SSD)

## 1 SkateStop Disc 3020

Vulcan Architectural offer a minimum deterrent in the product SkateStop discs. These have rounded edges, which makes them safe and discreet. SkateStop discs blend in with most architectural themes which means protection still looks good, property stays undamaged, safe and liability is minimized. These are very easy for rapid diy installations.

# 2 SkateStop Edge 120 (SSE)

Vulcan Architectural's SkateStop Edge product is a protection device which defers any grinding on hard scape property, and does not impact on intended use or visually impair designed beauty. This has the ability to be incorporated into any project design and can be engineered into grout lines or expansion joints.

Tiled hard scape seating area

Walls of  
planters

Feature  
brickwork

# 3

Vulcan Architectural offers SkateStop Max as the ultimate deterrent. Complete parapet cover, stopping scooters, bikes, skaters and skateboards, offers a mini speed hump and eliminates the long smooth edges that are sought for this pastime.

Made exclusively for your application in varying widths from 300mm to 750mm.

SkateStop Edge and Max are very much more effective than SkateStop discs, as the edge, face and top elevation are all covered.

## SkateStop Max (SSM)

Feature public seating areas

Parapets

... and  
what  
if we  
don't

...

## . . . Property damage

Firstly, skaters will need to wax the surface of the chosen wall. This gives them much better slip. Continued waxing and use totally discolour the immediate stone work.

At this point, stone work is still able to be cleaned with various means to nearly restore to original build quality. Although the sun and heat friction will have melted the wax into the porosity of the stonework.

Fitting Vulcan Architectural SkateStop at this stage will prevent .....

..... Severe chipping

..... & repointing costs

# Conclusion

SkateStop is a one off cost and means that your project stays looking as good, clean and safe as it was designed to be.

Setting out of these products should be 500mm – 700mm (SkateStop Discs) and 600 – 900 for the Skate Stop Edge Max. Distance from the ends can be 200 – 400 and SkateStop discs can be used at corners.

Vulcan can help at design stage and follow through the level of care by assisting the contractors. Layout and installation guides are available on request.

New build and retrofit are both able to be undertaken for your properties to stay looking great and minimise your liability.

Don't consider opening a new landscape until you have considered SkateStop.

Vulcan Architectural SkateStop products go hand in hand with our large range of Stainless Steel and Brass Tactile ground surface indicators.

Featuring a range of solid Brass and Stainless Steel enables use on hi end commercial projects, hotels and even listed buildings.

All products are based on the AFA/DDA sizing and meet regulation.
