

Kermi have achieved the impossible, an easy clean coating can now be applied to Kerolan glass providing a surface quality similar to single panel safety glass with the same cleaning advantages.

Kermi Clean has been microbologically tested and approved by independent institute meaning that it can be used without restriction in areas such as hospitals, hospices, care homes, schools, nurseries and similar installations.

Kermi Clean The Kermiclean coating for single pane safety glass is a special treatment providing an even surface coating which helps prevent the build up of limescale deposits, dirt and soap residue. Whilst Kermi Clean helps to prevent build up, cleaning is still important, although residues can be removed much easier and with significantly less effort. This can be compared with a teflon coated frying pan. This provides a positive effect on the environment by reducing the use of cleaning agents and is more hygienic as the hydrophobic /water repellent coating makes it difficult for bacteria and germs to stay on the surface.
