

Manufacturers display their unique BSI UPIN on/or attached to products.

Manufacturers register for BSI UPINs and manage a controlled source of up-to-date information.

UPINs are referenced within specification.

Asset and Facility managers, through UPINs, get access to accurate product information and a link to further information, which supports management of the installed product.

Contractors can easily identify products and gain access to a controlled source of information using UPIN.

Through the use of UPINs, asset owners are given confidence that they are getting a result that meets their expectations.

UPINs act as a tool to check against suggested substitutions; helping to ensure the result meets the original specification.

Easy product identification on site using UPIN helps to ensure the right product is installed and acts as a deterrent to fraudulent project substitution.

**Easy product identification**
