Fireproof DAD UK Mailboxes

(Fitted as an extra inside DAD UK mailboxes)

DAD UK Ltd can now offer an added security against Arson. Specially fitted tubing as shown below can be fitted to almost all of our mailbox range to ensure that should a fire break out, the fire can be extinguished at source.

Advantages

Installation of tubing into DAD Mailboxes is quick and easy and very cost effective. There is no requirement for an external energy or power supply therefore eliminating the need for electrical installation or wiring. By using this system there is also a greatly reduced risk of malfunction because there are virtually no moving parts, which reduces the risk of false alarms.

The pressurized tubing discharges the extinguishant directly from the burst hole in the tube, this will be the closest point to the fire, and will allow the fastest extinguishing time and minimum spread of the fire. The automatic detection tubing should be considered as a lineal heat / flame detector. When the temperature is increased to above 120°C or the automatic detection tube is touched by a flame, the tube bursts, putting the fire out at source.
