

## Pagwood to achieve that Ultimate Protection when using wood

In order to achieve the highest product standards and long lifespan when using wood Erlau use Pagwood.

### What is Pagwood?

Pagwood is resin-soaked wood-core plywood made of wafer-thin veneer of the indigenous copper-beech tree.

Pagwood is unbreakable and crack-proof, waterproof and even resistant to chemicals. It retains its beauty over a long period as its UV-protection prevents colour fading, and it's easy to clean. It dries faster than solid wood after a downpour, and puddles of unabsorbed rain water cannot form.

When Pagwood is left totally unprotected outdoors it is essential that it is cleaned and polished at least once a year using "Polish Rosa" Article Nr. 80345 from 3M in order to maintain its beautiful surface.

### Advantages of Pagwood

- Crack-proof and unbreakable due to the extreme compression of the material
- Water and chemical resistant
- Fungi and bacteria resistant, anti-static
- UV-proofed, therefore no fading of the colours
- Shock-resistant and low-maintenance
- Environmentally conscious, as it is produced solely from replaceable raw materials
- Easy to clean – no retained rainwater
