

Technical Data

Saunas

Composition and manufacture

Manufactured using 12mm internal and external, tongued-and-grooved, Scandinavian spruce panelling, the insulated 75mm thick wall and ceiling panels provide an efficient and comfortable bathing environment. Helo's sauna cabins are freestanding units. Walls and ceiling are a sandwich construction (internal and external panelling), with a core consisting of Rockwool insulation and an aluminium vapour barrier. Sauna heaters are available for both single- and three-phase supplies and, dependent on kW rating, either wall or floor mounted.

Sitework

Helö recommends that its own in-house, fully-trained engineers fit its sauna cabins. Site inspection is provided, together with the production of all necessary work drawings.

Environment

Materials are sourced from renewable resources. Sauna cabins are available with DDA-compliant doors and two-toned interior fittings, to ensure that those with visual impairments can also safely enjoy of sauna bathing.
