

Technical Data

Stairs

Composition and manufacture

M & G Olympic's in-house CAD design team is happy to work with specifiers during the design stage of any project to produce initial designs and fabrication drawings, and will undertake site surveys and offer the benefit of its experience throughout a project.

Appearance

Straight-flight, helical and spiral staircases, manufactured from mild steel and stainless steel.

Staircases can incorporate steel, timber or glass treads.

Balustrades: structural glass, vertical or horizontal bar, wire rope or toughened glass infill panels, aluminium or perforated-plate infills.

Baluster/top rails: stainless steel, galvanised or powder-coated mild steel in solid or metallic colours to match the colour scheme of the building. Solid timber top rails are also a very popular option.

The company also offers a range of semi-modular balustrading systems for cost-effective site assembly, which includes a choice of alternative components and finishes, designed to meet the demands of architects, specifiers and contractors alike.
